

ABSTRACT

A speaker including a frame, a diaphragm fixed to the frame through a first edge, a voice coil, a magnetic circuit, and a suspension holder fixed to the frame through a second edge is disclosed. The first and the second edges are spaced apart, and substantially symmetrical in shape with respect to the space between them. The inner periphery of the suspension holder and the inner periphery of the diaphragm are fixed to a part of the voice coil which is located outside of the magnetic gap of the magnetic circuit. The magnetic circuit has a magnet provided outside of the bottom of the frame. The outer periphery of the magnetic extends at least beyond the center of the second edge. The magnetic gap of the magnetic circuit is disposed inside of the frame, above a bottom surface of the frame.
